The problem with (electric) vehicles
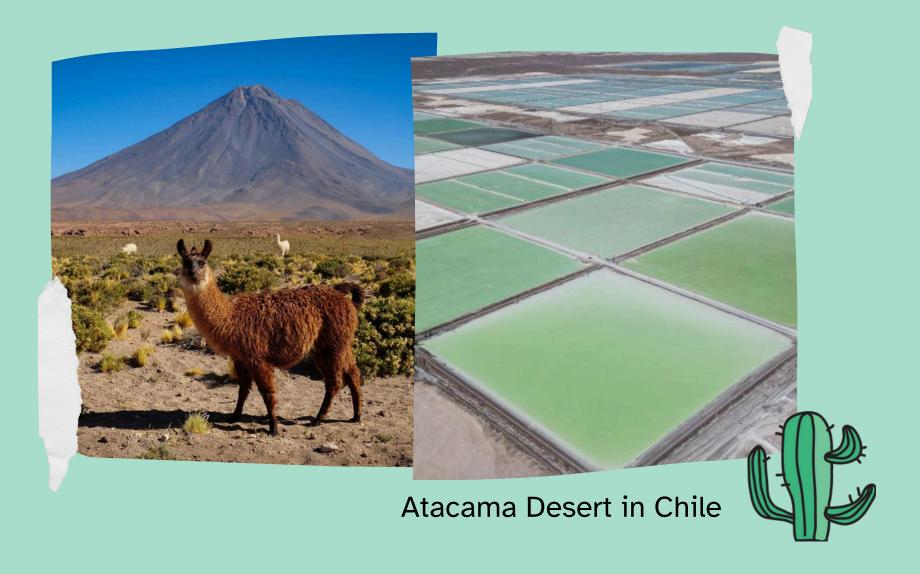

Vehicle traffic is a climate killer - in Germany alone it is responsible for 100 million tonnes of CO_2 per year.

Battery-powered electric cars are viewed as the new climate-friendly option.

However, lithium - a limited natural resource - is needed to manufacture the batteries. Lithium is mined in Chile, for example.

Atacama Desert in Chile

This neo-colonial exploitation has dire consequences for people and beyond-people on the ground.

Plus, electric cars also cause CO^2, accidents and take up space.

Let's ditch cars and focus on bicycles, free public transport and globally just mobility for all!
