

# Myths of green growth

Politicians and corporations have a dream: they hope that technical innovations will allow the economy to continue to grow without destroying the climate.

From a global perspective, however, they are only exacerbating socio-ecological injustices and further heating up the planet.

For example:

# The problem with green hydrogen (H<sup>2</sup>)

European industry is focusing on green hydrogen as the "climate-neutral" fuel of the future.

H<sup>2</sup> is to be imported on a massive scale from the global South, but this perpetuates colonial injustices:

Resources such as land, water and raw materials are being reserved for the growth of European industry.

Instead they could be used for a local, democratic energy transition in the countries of the Global South.

Besides, the technology is not advanced enough to actually reduce the global carbon footprint.

We much rather need industrial deconstruction for a socio-ecologically just economy!
